

Authentication - Flashcards

Q1: What is the purpose of authentication in network security?

A: To ensure that a communication is authentic and comes from a legitimate source.

Q2: What are the two authentication services defined in X.800?

A: 1. Peer Entity Authentication

2. Data Origin Authentication

Q3: What does Peer Entity Authentication verify?

A: It verifies the identity of a peer entity during communication setup.

Q4: What threats does Peer Entity Authentication protect against?

A: Masquerade and replay attacks.

Q5: Give an example of Peer Entity Authentication.

A: Two TCP modules verifying each other in a connection.

Q6: What does Data Origin Authentication verify?

A: The source of a data unit in a connectionless transfer.

Q7: What does Data Origin Authentication not protect against?

A: Duplication or modification of data units.
